

- We have used google chrome.
- In the chrome webstore we have downloaded katalon recorder for selenium test generator.
- Add katalon recorder extension.
- Orange hrm website e gesi.
- Turned on Katalon recorder on.
- Website log in.
- Katalon recorder off.
- We got multiple command target and value.
- If we press play button it will show us the whole process which we have recorded.
- We can export the recording in a different format (C# ms test, C# nunit, Java test ng, java junit, java remote control + junit, katalon studio, python, python 2, robot framework, ruby, XML)
- We can save the test cases then.
- We can use this test case for other projects as well.

So we have understood that selenium framework is used to generate a test case for a particular website.
